EXTREMA

PRO SERIES Q U I E T F A N S

QUICK INSTALLATION GUIDE

1

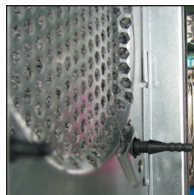

Remove your existing case fans, if necessary.

Required Tools

Philips-head screwdriver
Pliers

2

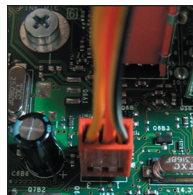

Place the silicone vibration dampening mounts in the applicable mounting holes. The pointed end of the mount should face into the case. If the silicon fan mounts do not work with your case, you can use the provided mounting screws instead.

3

Place the fan in the desired location, lining up the fan mounts with the mounting holes on the fan. Pull the end of the fan mounts through the holes with a set of pliers or a similar tool.*

4

Plug the fan into the motherboard or to the power supply using the supplied converter cable.

Notes

Some motherboards may refuse to boot if they cannot register RPMs below a threshold. If this is the case, either override the relevant feature in your BIOS or use the provided converter to attach the fan directly to the PSU.

The silicone vibration dampening mounts and the mounting screws are not to be used together. Some cases may not be able to use the silicone mounts, in which case you can use the optional screws.

If you are using the SilenX® Xtrema™ Pro fan to replace an existing heatsink fan, please consult your heatsink documentation to determine compatibility and for specific installation instructions.

Noise measurements are taken in an anechoic chamber from a distance of 1m along each of the 3 axis. The geometric mean is used to determine the rating. Actual noise output may vary depending on the ambient temperature and obstructions in the airflow path. Specifications can deviate <15% depending on your environmental conditions and input voltage.

*Determine whether the fan will be used for intake or exhaust. The label faces the direction of airflow. If you want to use the fan for intake, the label should face into the case. If you want to use the fan for exhaust, the label should face away from the case.
